Residential/Homeowner Treated Wood Waste (TWW)

*Treated wood is wood that has gone through a treatment process with chemical preservatives to protect it against pests and environmental conditions. Typically, treated wood is used in exterior applications where ground or water contact is likely. With wooden fence construction, it is used as a post. ***It is rarely an entire wooden fence.***

- What qualifies as treated wood?
 - Treated wood means wood that has been treated with a chemical preservative for purposes of protecting the wood against attacks from insects, microorganisms, fungi, and other environmental conditions that can lead to decay of the wood. These preservatives often include one or more of the following: arsenic, chromium, copper, pentachlorophenol, and creosote.
- What *doesn't* qualify as treated wood?
 - Natural wood with no chemical preservatives.
 - *Natural wood that is painted or has a surface finish such as lacquer, shellac, polyurethane and varnish.*
- Variance and Forms
 - A homeowner does not require a variance from state law to discard TWW
 - A transfer station or landfill authorized to accept TWW from a homeowner ***is required to collect contact information*** and pass it on to California Department of Toxics and Substance Control (DTSC). The contact information will be used by DTSC to identify anyone that is repeatedly shipping TWW.
